

# ENSURING RETAIL PRODUCT QUALITY WITH REAL-TIME IoT REPORTING

## THE CHALLENGE

While consumers are increasingly concerned about food quality, the ability of retailers to guarantee the standard of their agricultural crops and food items is currently compromised by the “black box” of actual conditions, such as temperature and humidity, during the processing, packaging and shipment.

## OUR SOLUTION

Through deploying many sensors that constantly measure the conditions in close proximity to the crop, we are able to provide a high-resolution overview of the state of the product across the value chain.
